

# Q – Where are **hotspots** of ecosystem services in NatCapia?

## QUESTIONS FOR DISCUSSION:

- How will you identify hotspots? What criteria will you use?
- Do the locations of ES hotspots change in one (or more) of the scenarios? How?

## YOUR PRESENTATION:

- 1) Single map of hotspots for multiple services
- 2) Explanation of the methods you used to create the map

Optional: How do the hotspot areas change as you alter InVEST parameters in sediment?

# Accessing impacts/benefits – how do ecosystem services change over time?

## QUESTIONS FOR DISCUSSION:

- What is the change in sediment, timber, and carbon between the baseline and the two scenarios?
- Do the benefits keep increasing over time? For all services or just some of them?

## YOUR PRESENTATION:

- 1) Graph of change in services
- 2) Explain methods and results

Optional: What is the relative change in services between scenarios? Is this different for the various services? Why?
