RIOS IN CONTEXT

RIOS IN CONTEXT

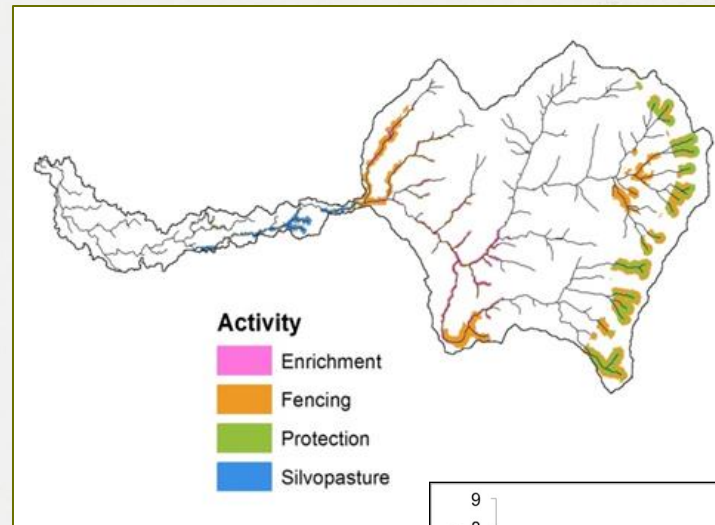

GOALS

- Invest in watershed services with limited budget
- Maximize improvement in multiple services

QUESTIONS

- Which activities are most cost-effective?
- Where should I do them?

IMPROVING INVESTMENT OPTIONS WITH RIOS

- Must address *physical realities*, *feasibility*, and *cost effectiveness*
- Know where you can get best results for *multiple goals* AND where it is *practical* to work
- Need a method that is *robust* and *replicable* with local capacity

RIOS INPUTS

Biophysical
effectiveness

Feasible
activities

Stakeholder
preferences

Cost data
Budget

Investment
Portfolio

TYPES OF DATA

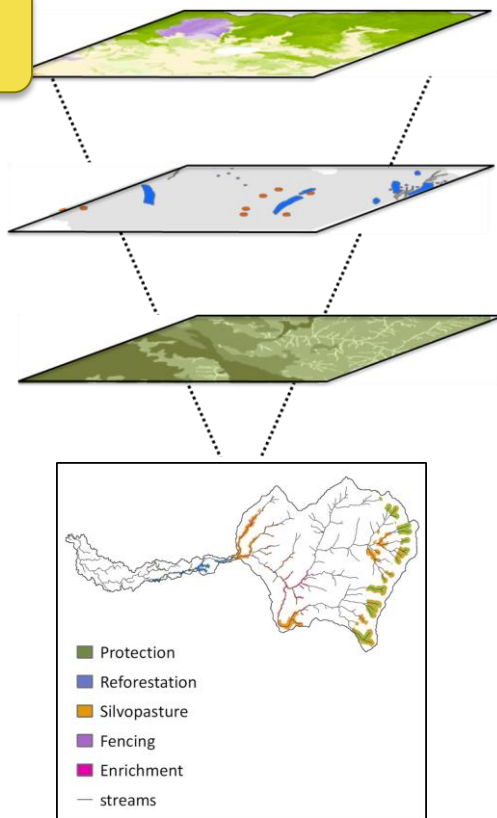

Biophysical effectiveness

Feasible activities

Stakeholder preferences

Cost data
Budget

Investment portfolio

Land use/Land cover

Vegetation retention, land practice and management

Topography

Digital elevation model, slope threshold

Erosivity

Based on intensity and kinetic energy of rainfall

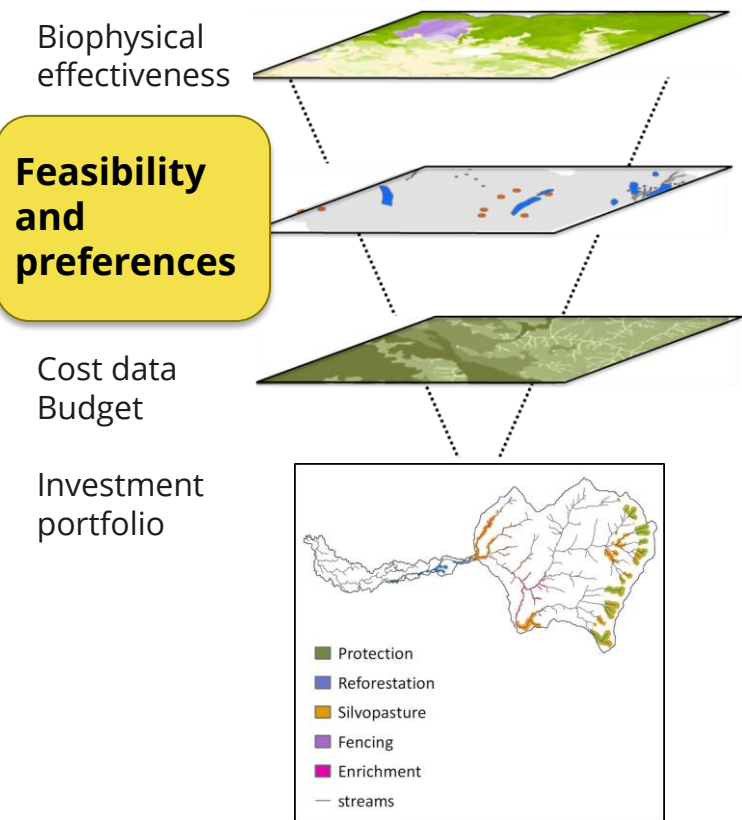

Erodibility

Soil detachment and transport potential due to rainfall

Watershed Areas

Catchment areas, beneficiaries

TYPES OF DATA

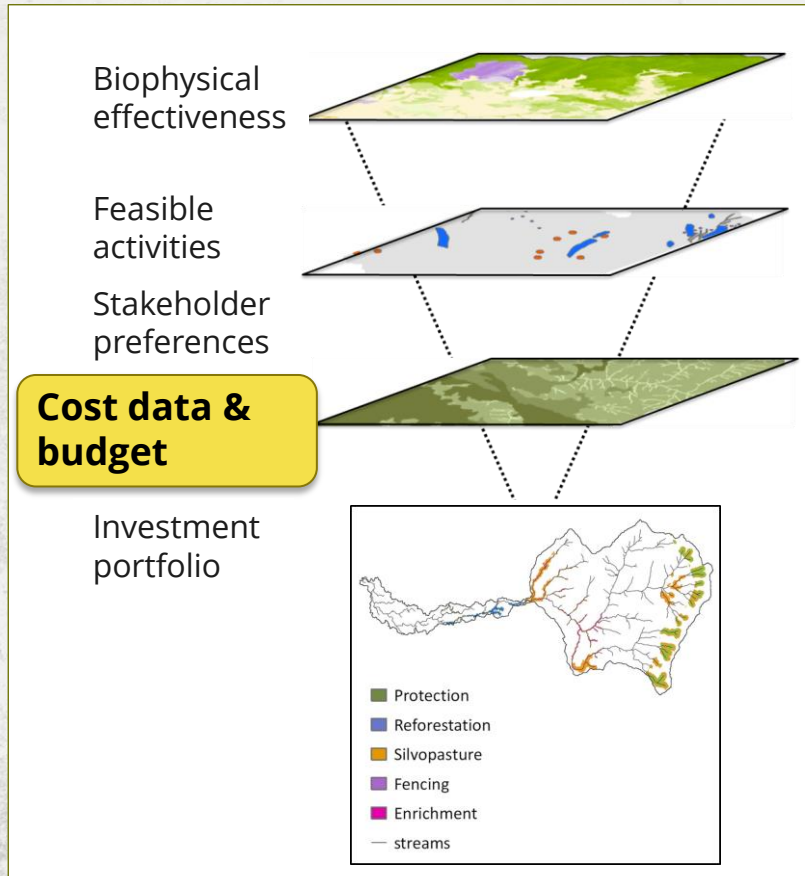

Stakeholder preferences

Legal and logistical restrictions

Opportunity cost

Feasible locations

TYPES OF DATA

How much do activities cost?

Implementation, maintenance, payments

Total budget \$

Biophysical
effectiveness

Feasible
activities

Stakeholder
preferences

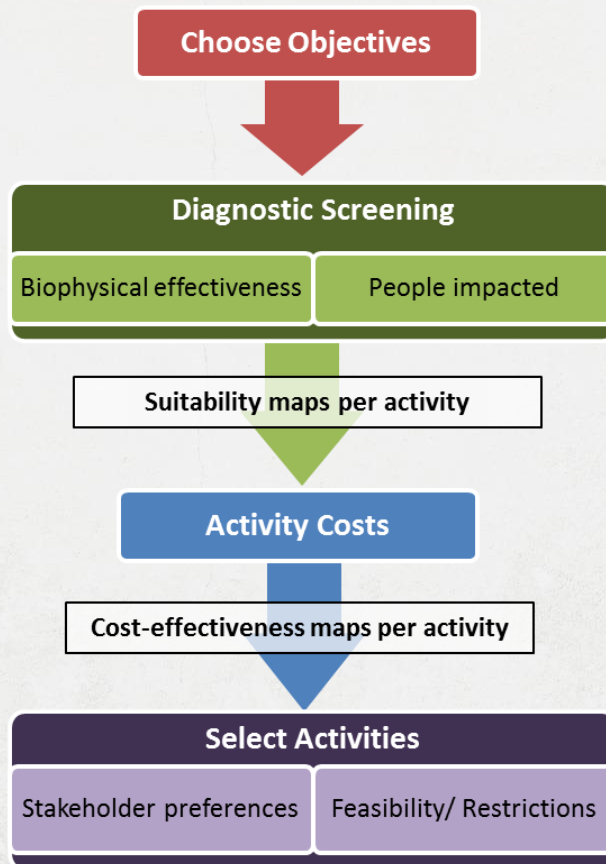

Cost data
Budget

Investment portfolio

- Protection
- Reforestation
- Silvopasture
- Fencing
- Enrichment
- streams

OVERVIEW OF RIOS WORKFLOW

CHOOSE OBJECTIVES

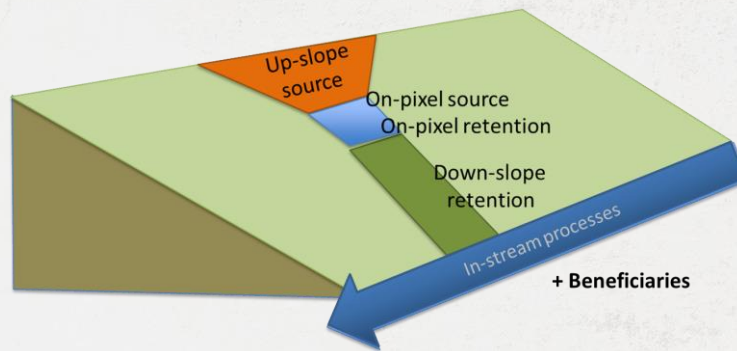

SERVICES

- Erosion Control
- Nitrogen Regulation
- Phosphorus Regulation
- Groundwater Recharge
- Flood Mitigation
- Dry Season Baseflow
- Biodiversity
- "Other"

DIAGNOSTIC SCREENING

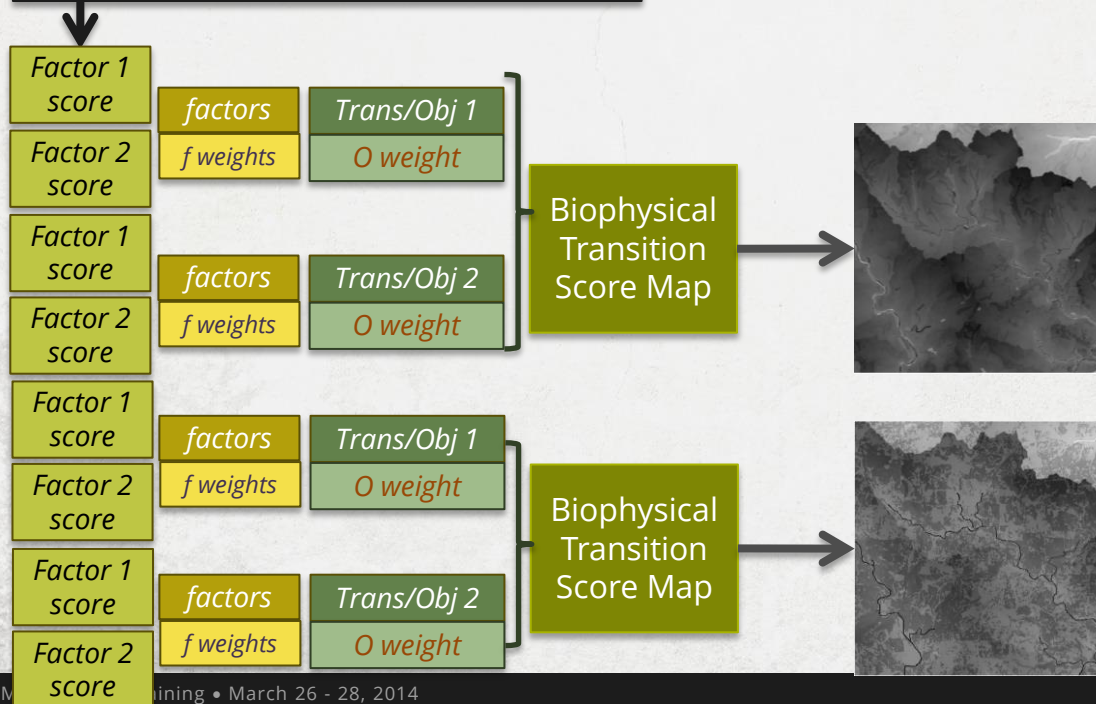

KEY FACTORS

- Factors determined through literature review
- Compromise between process representation and data availability
- Determine effectiveness of *transitions* for meeting objectives, in a specific place

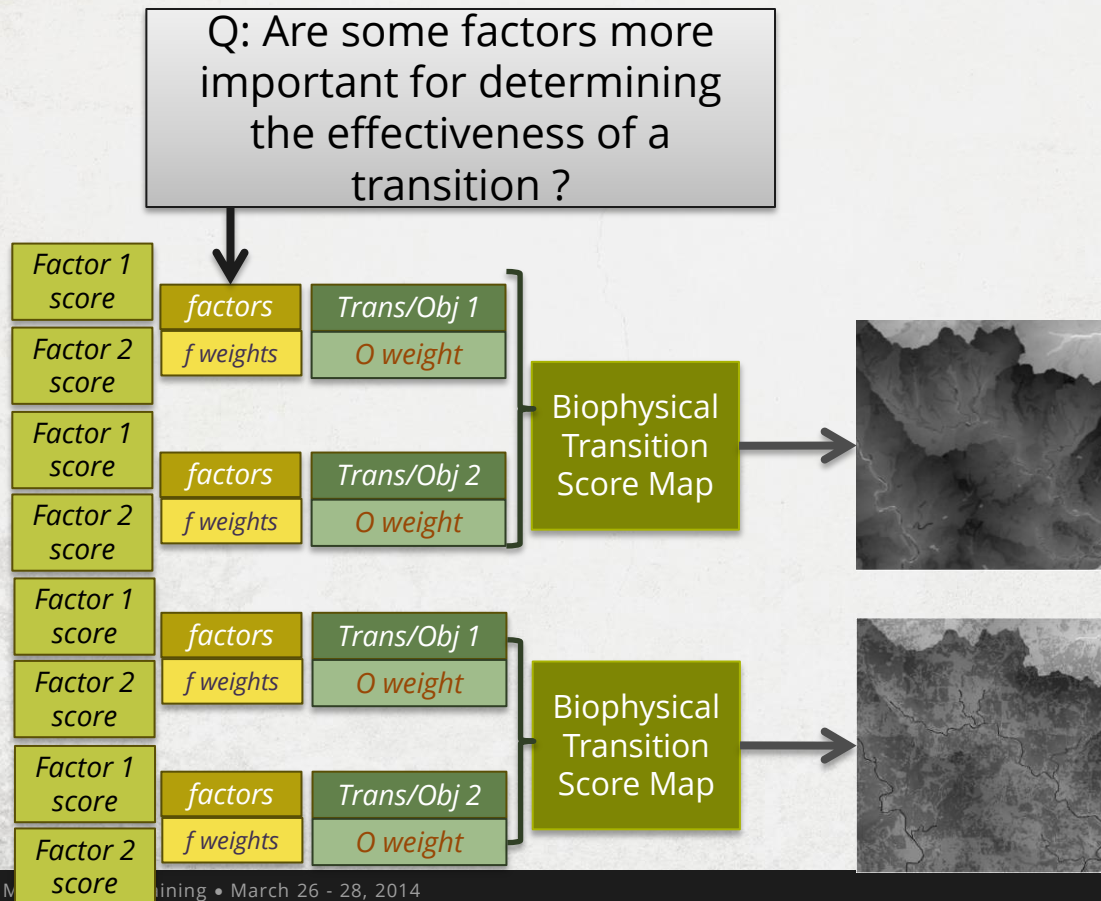

ACTIVITY SCORES

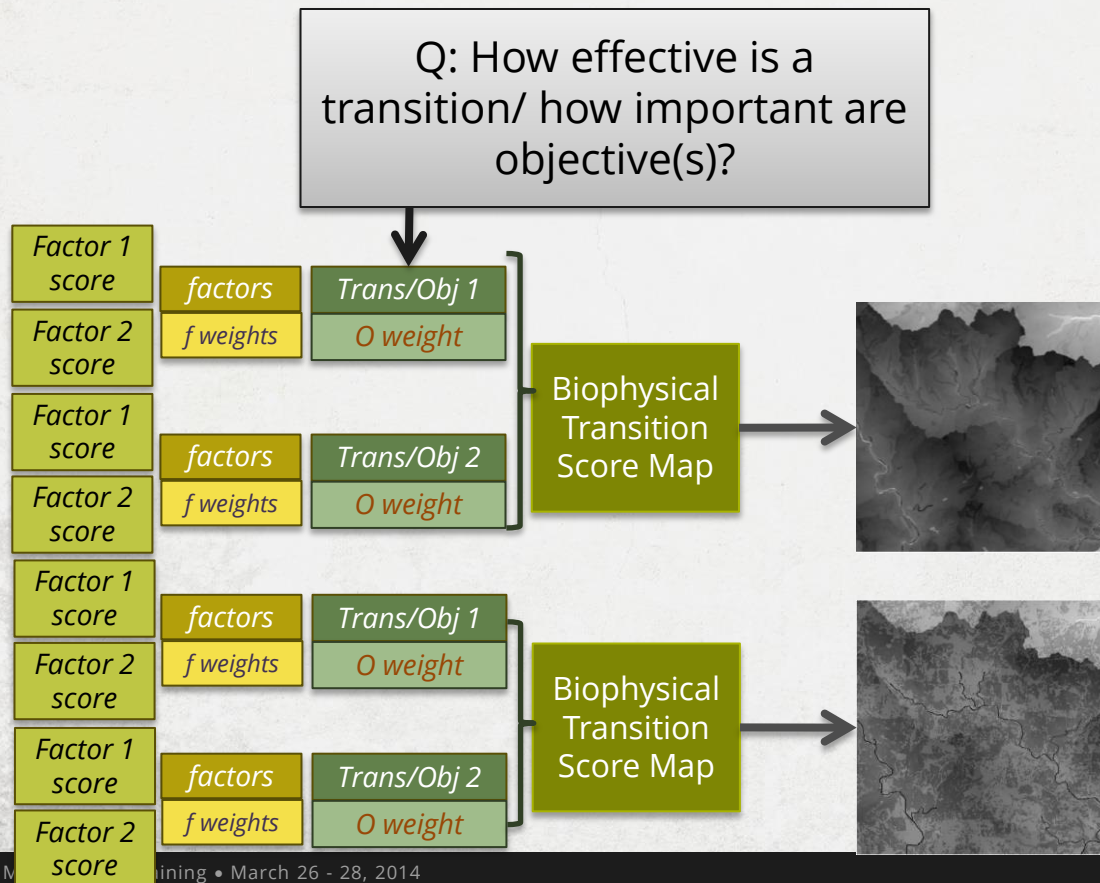

Q: How do landscape characteristics compare to the ideal for each transition?

ACTIVITY SCORES

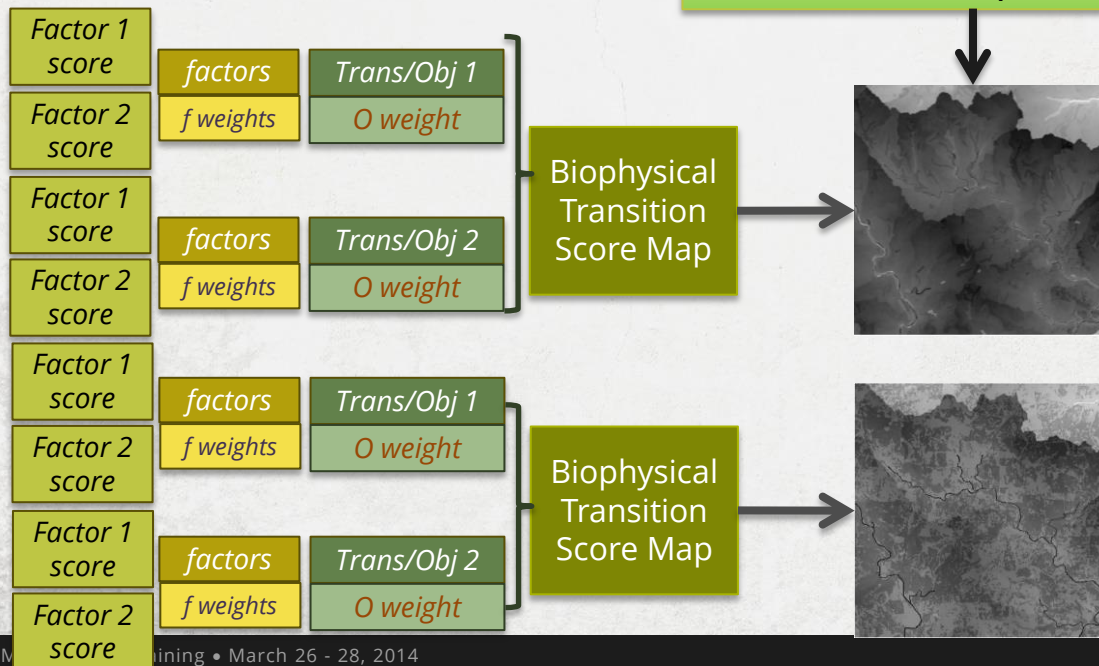

ACTIVITY SCORES

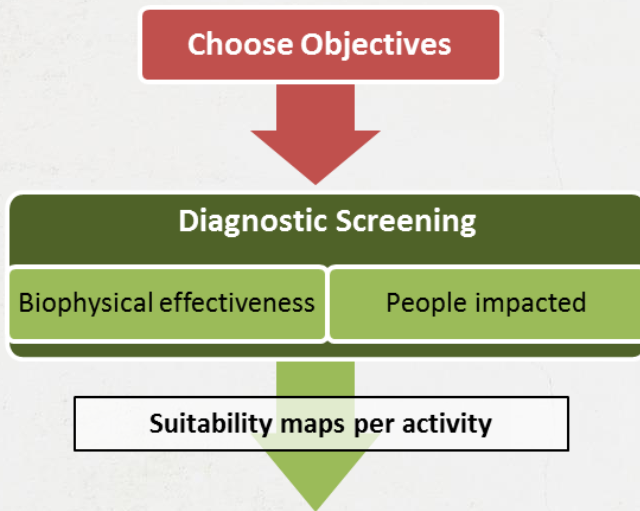

ACTIVITY SCORES

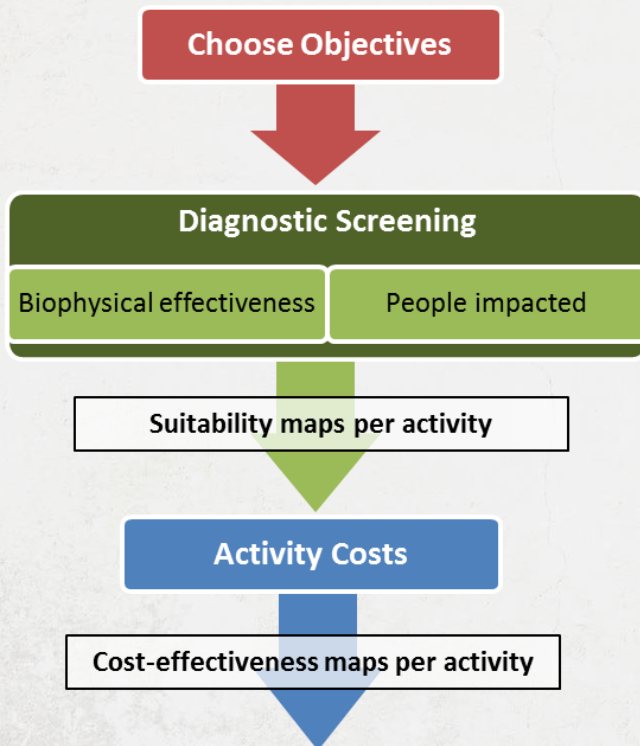

A: The best places to
create each transition,
considering all objectives it
can impact

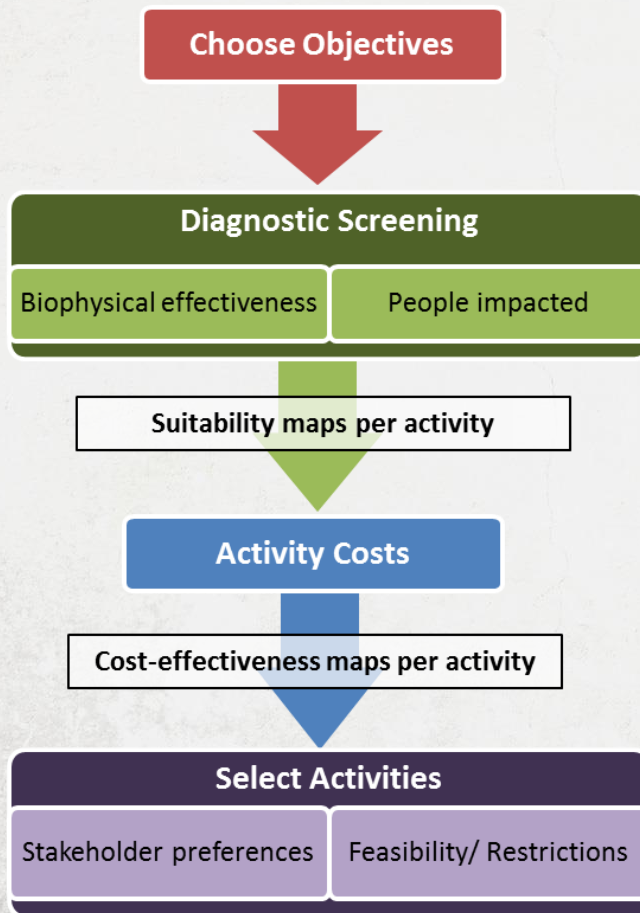

RIOS Steps

RIOS Steps

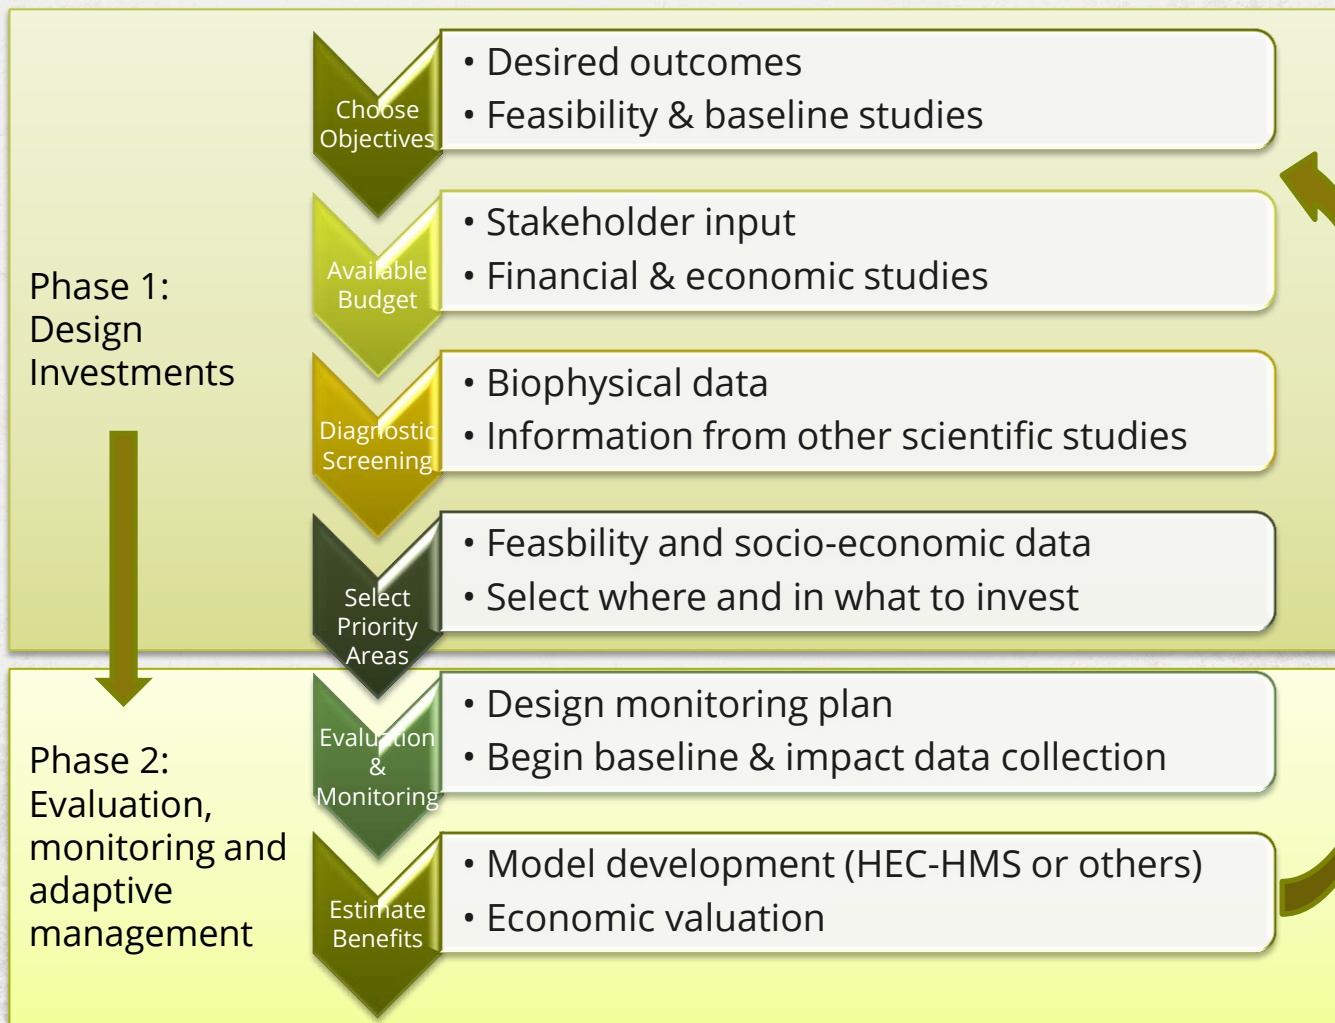

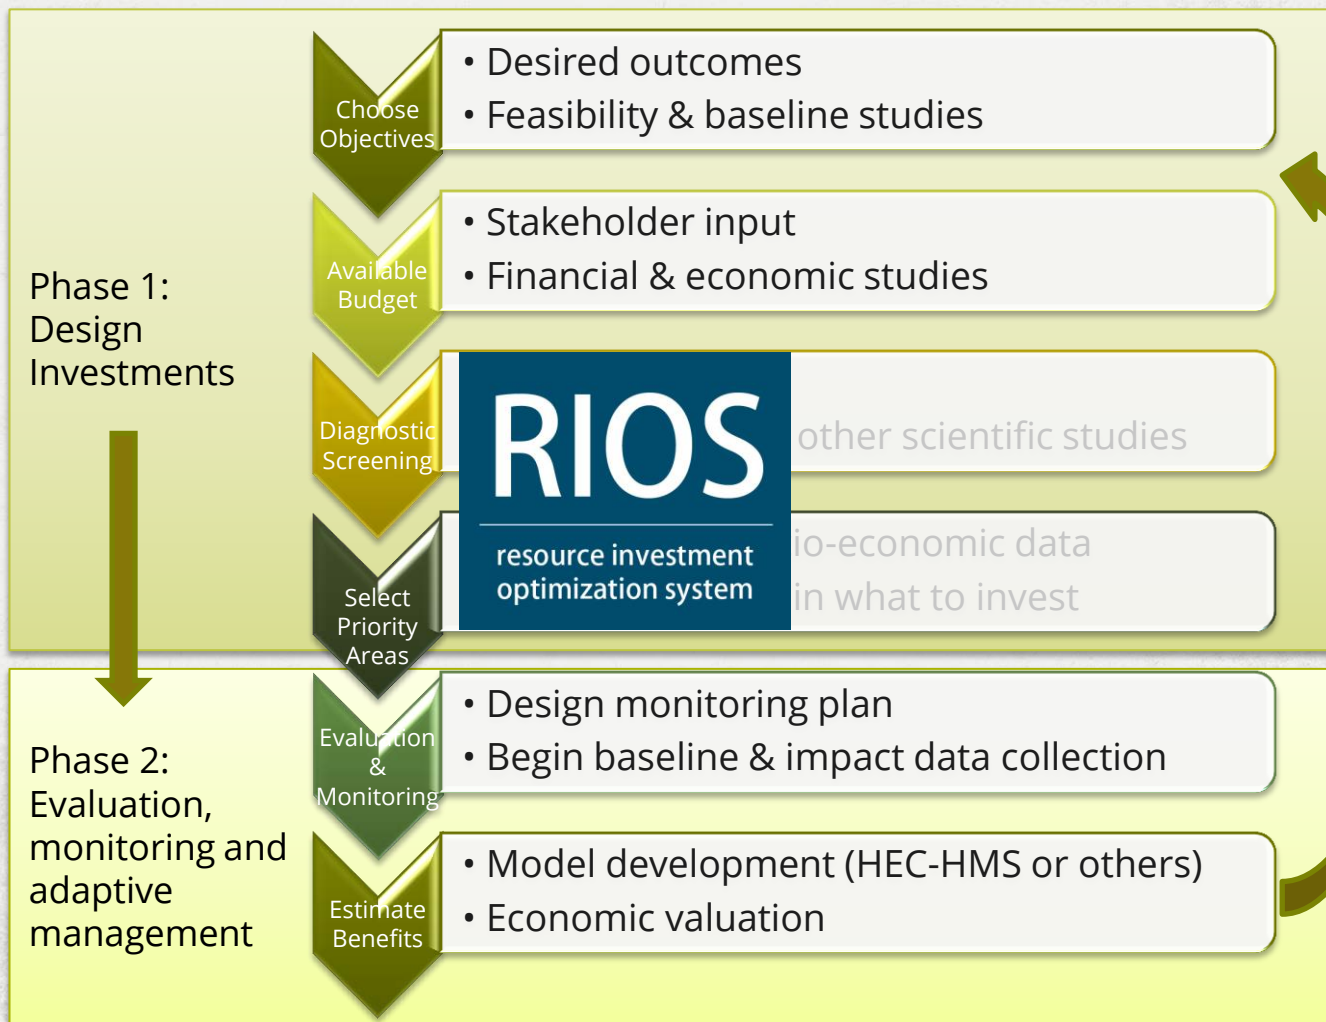

RIOS Steps

WHAT activities to
invest in and **WHERE**

ACKNOWLEDGEMENTS

Development of the RIOS tool was funded by the Gordon & Betty Moore Foundation.

Special thanks to the Water Funds Working Group and the Latin American Water Funds Platform

RIOS DATA REQUIREMENTS

March 27, 2014

Stacie Wolny
swolny@stanford.edu

DATA SOURCES

The best data is as local as you can get, as detailed as you need

- National, local governments and agencies, NGOs...
- Literature search – LULC coefficients

GLOBAL SOURCES

- Land cover: MODIS, GlobCover
- DEM: NASA, USGS, WWF HydroSheds
- Soils: FAO Harmonized World Soil Database, SOTER

CLIMATE DATA

Weather stations: ≥ 10 year average; Interpolation

WorldClim: Monthly precipitation

CGIAR: Monthly precipitation, potential
and actual evapotranspiration

NCAR: Climate change scenarios (precip only)

Erosivity: Can be derived from annual precipitation

AET: From InVEST Water Yield model, or CGIAR

BUDGET DATA

- Talk with water fund managers and/or stakeholders
- Costs can include implementation, maintenance, PES payments ...

If you don't have well-defined budget info:

- Look at existing PES programs for costs
- WOCAT may have sample costs from particular projects around the world
- For multiple watersheds, can allocate based on area, number of beneficiaries...
- Within a watershed, can allocate based on area of each LULC where activities can be done

COMMON DATA ISSUES

Projections: All GIS layers must have the same projected coordinate system

Clipping:

- Rasters should completely cover watershed
- Use watershed boundary as a mask
- Can resample coarse layers or buffer

Tables: Required field names and data types

DEM: Fill in missing data, fill sinks, check hydrology

Check for correct units on all inputs

PRE-PROCESSING

ArcGIS tool

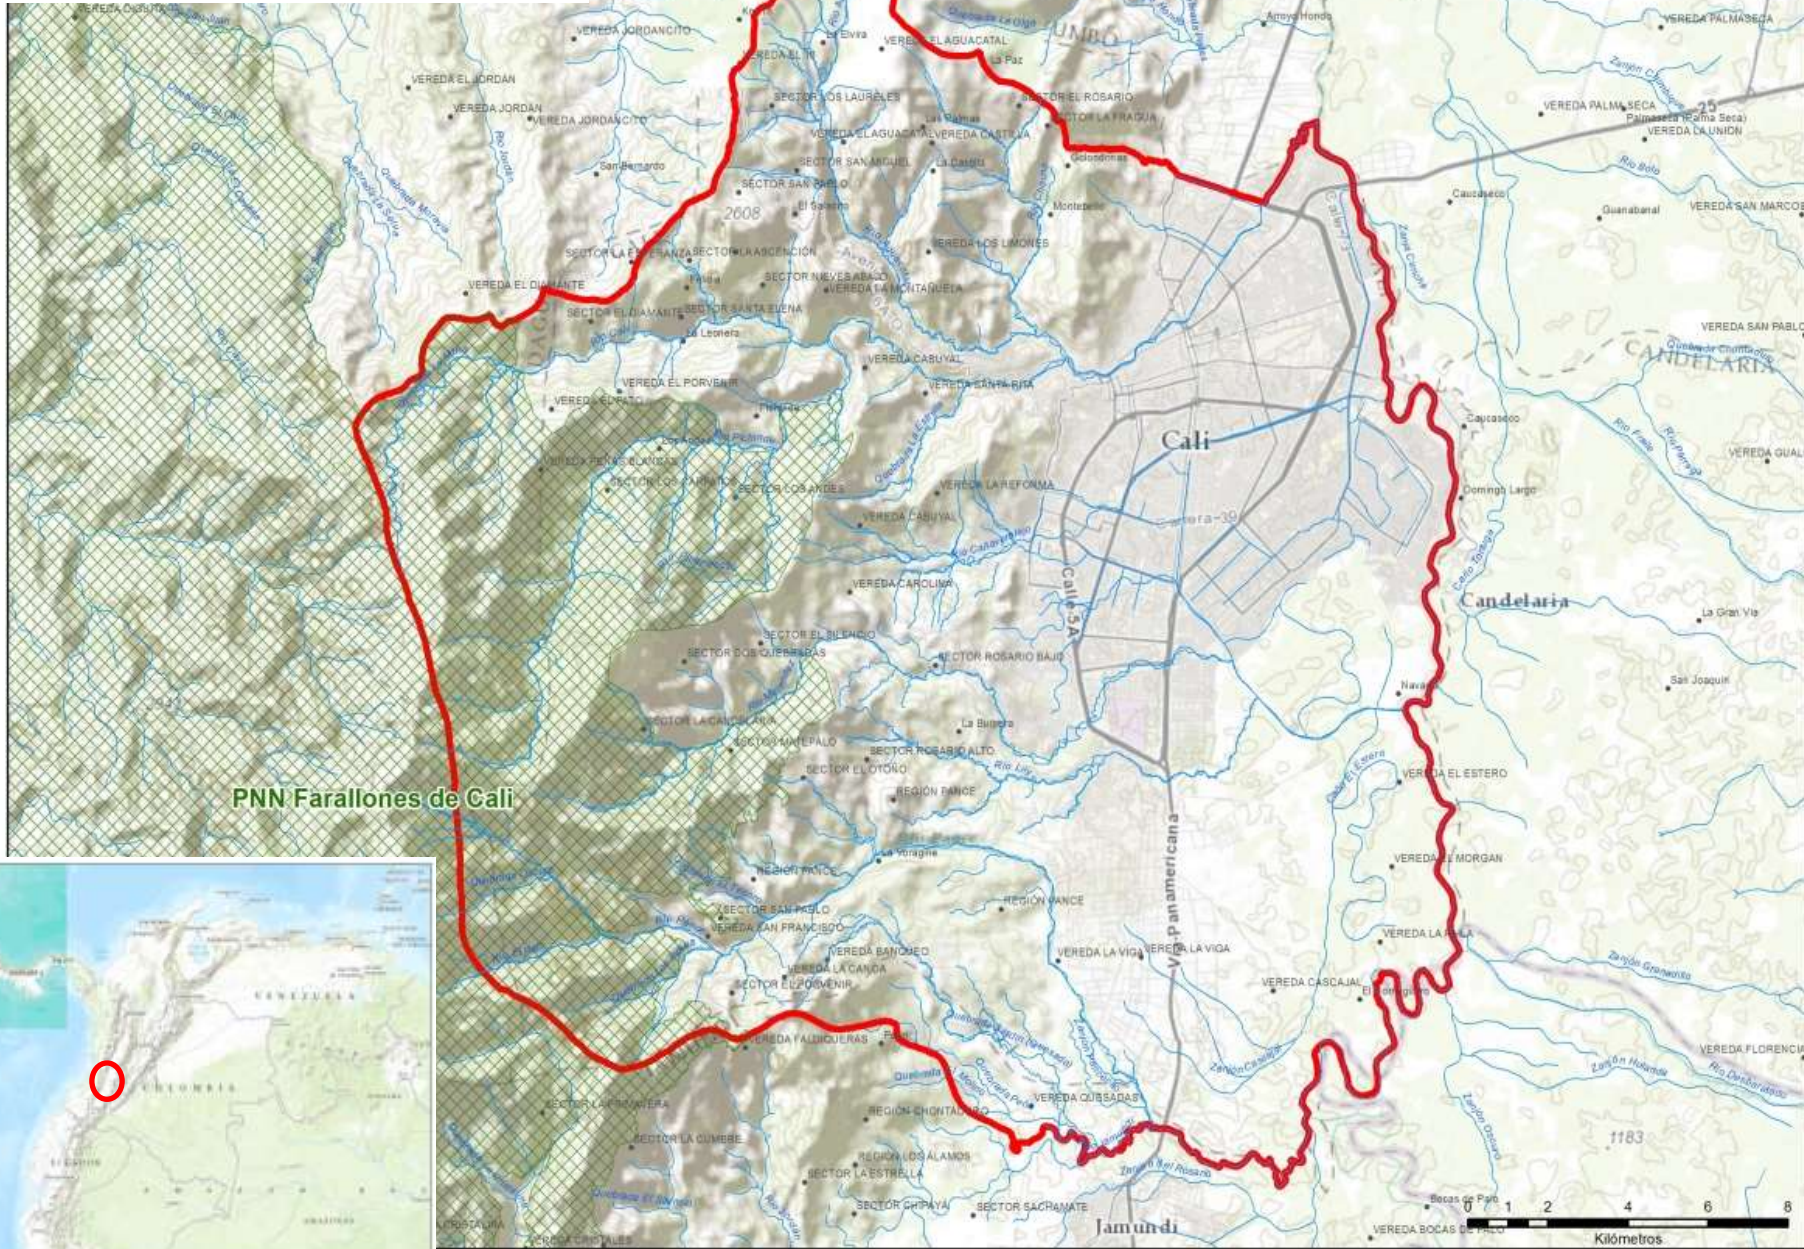

Creates several required inputs to RIOS:

- Upslope source
- Downslope retention
- Riparian continuity
- Slope index

Let's check it out...

Área de trabajo

Objectives

- Erosion control
- Flood mitigation
- Base flow

Landuses and activities

Uso del suelo	Protección	Restauración	Agricultura sostenible	Ganadería sostenible	Aislamientos

Activities

- Protection: conservation schemes in ecosystems in good condition. Rangers, PES, conservation agreements.
- Sustainable agriculture: modification of agriculture to make it more sustainable. Hedges, vegetation to avoid soil loss, reduction of agrochemicals.
- Sustainable cattleranching: silvopastoral systems.
- Fencing: areas in good condition to guarantee its conservation or in degraded areas to favour succession processes. Preferable in areas adjacent to rivers.

Activities

- Restoration: repair of stable ecological conditions through the introduction of native vegetation, preventing soil loss and reducing human pressure.

Prevent/prefer

- Prevent
 - All activities BUT “restoration” inside the National Park Farallones de Cali.
 - “Protection”, “Agriculture” and “Cattle ranching” inside forest reserves.
 - “Agriculture” and “Cattle ranching” in a 50 meters buffer from a river.

Prevent/prefer

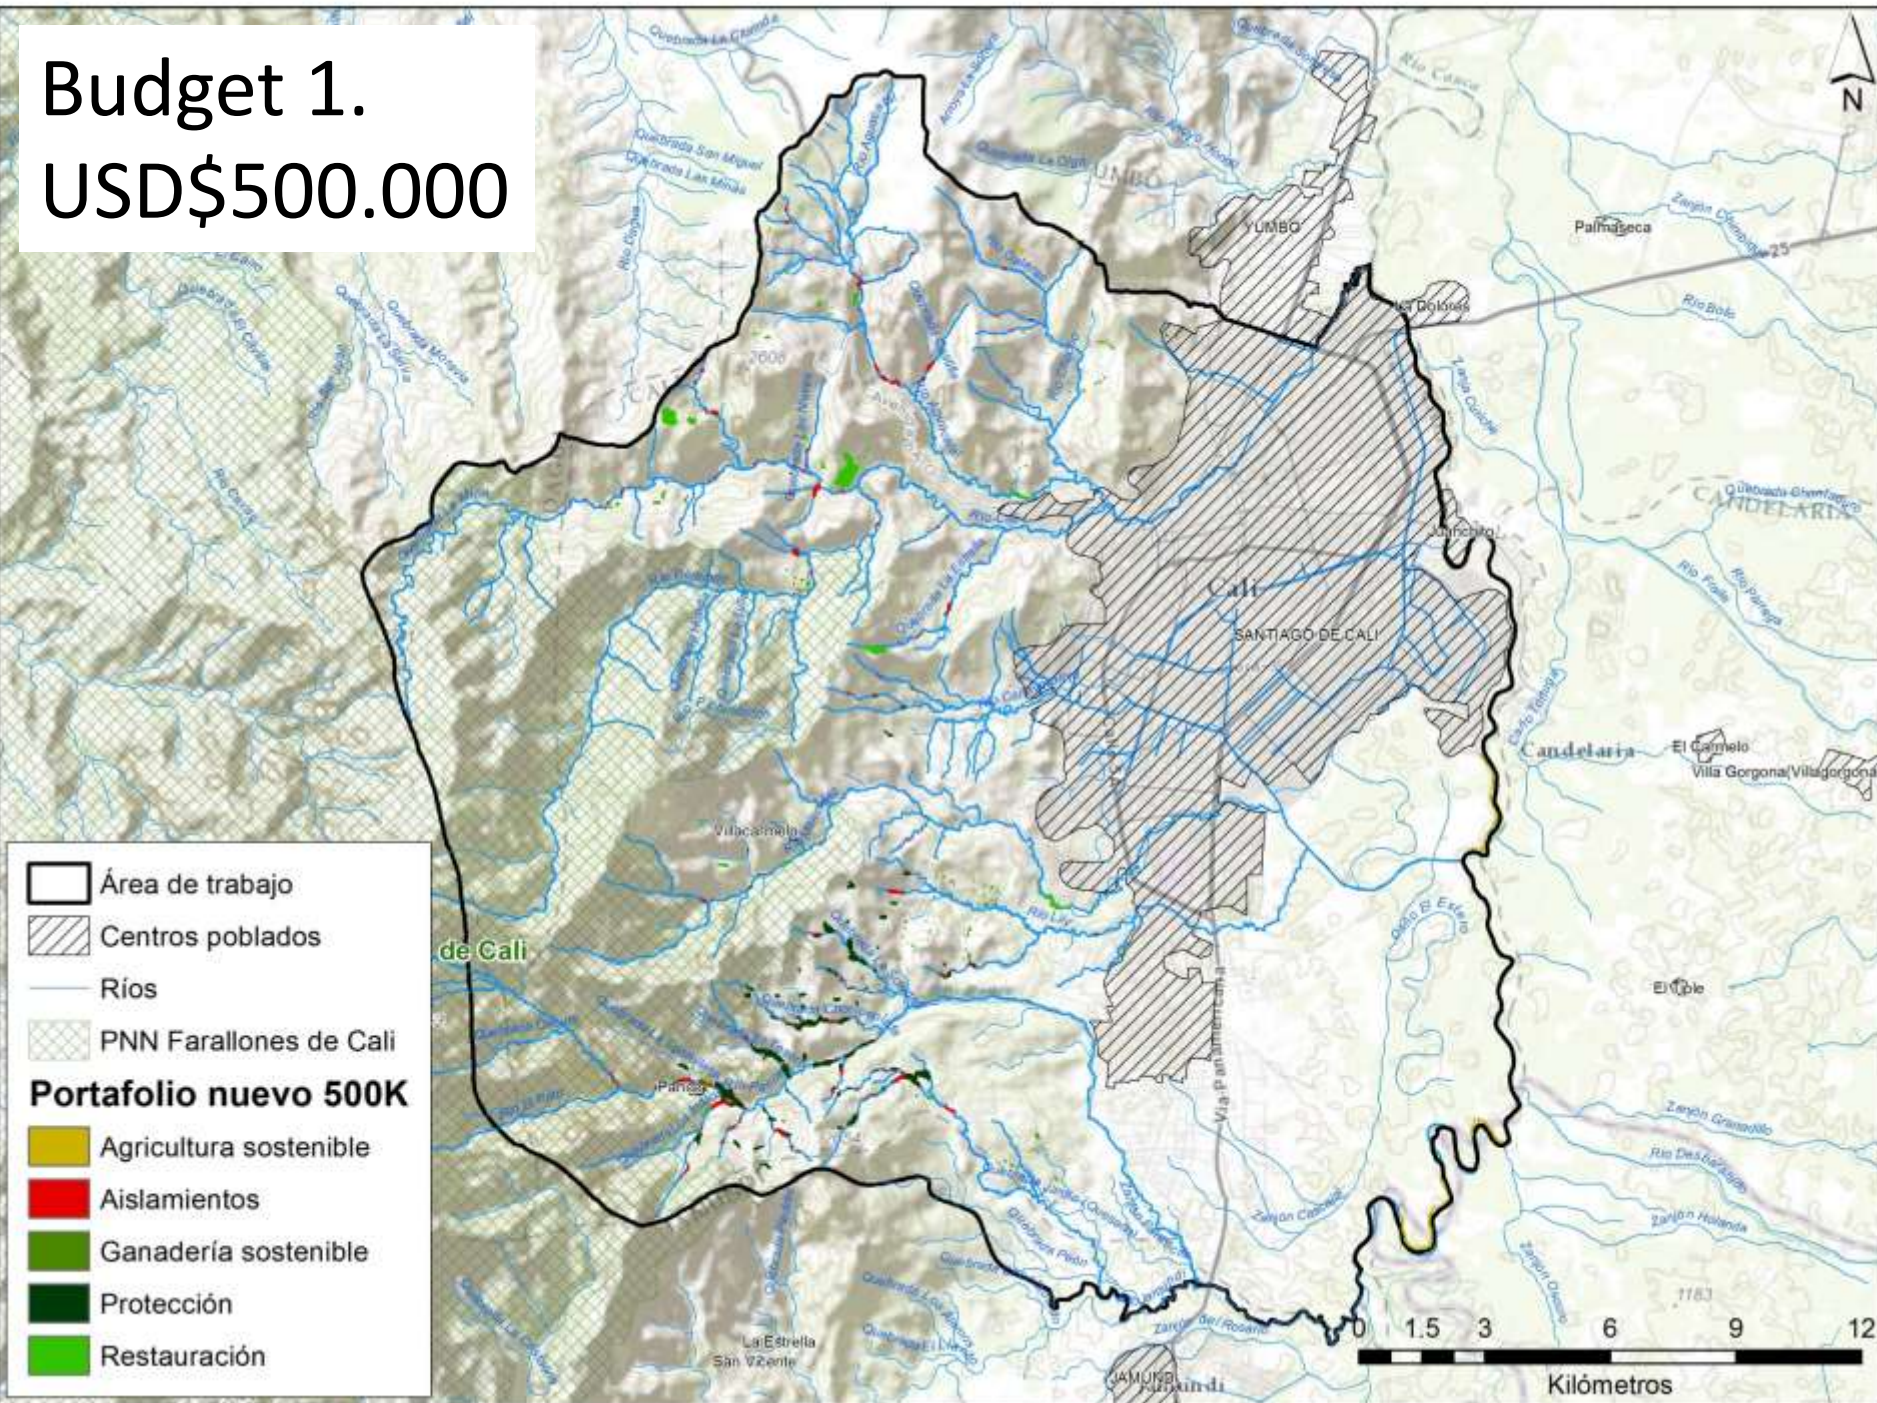

- Prefer
 - “Restoration” in forest reserves
 - “Restoration” and “Fencing” in a 50 meters buffer from a river.

Costs

Activity	Cost (USD\$/year)
Protection	200
Restoration	1070
Sustainable agriculture	2930
Sustainable cattle ranching	2930
Fencing	643

Portfolios

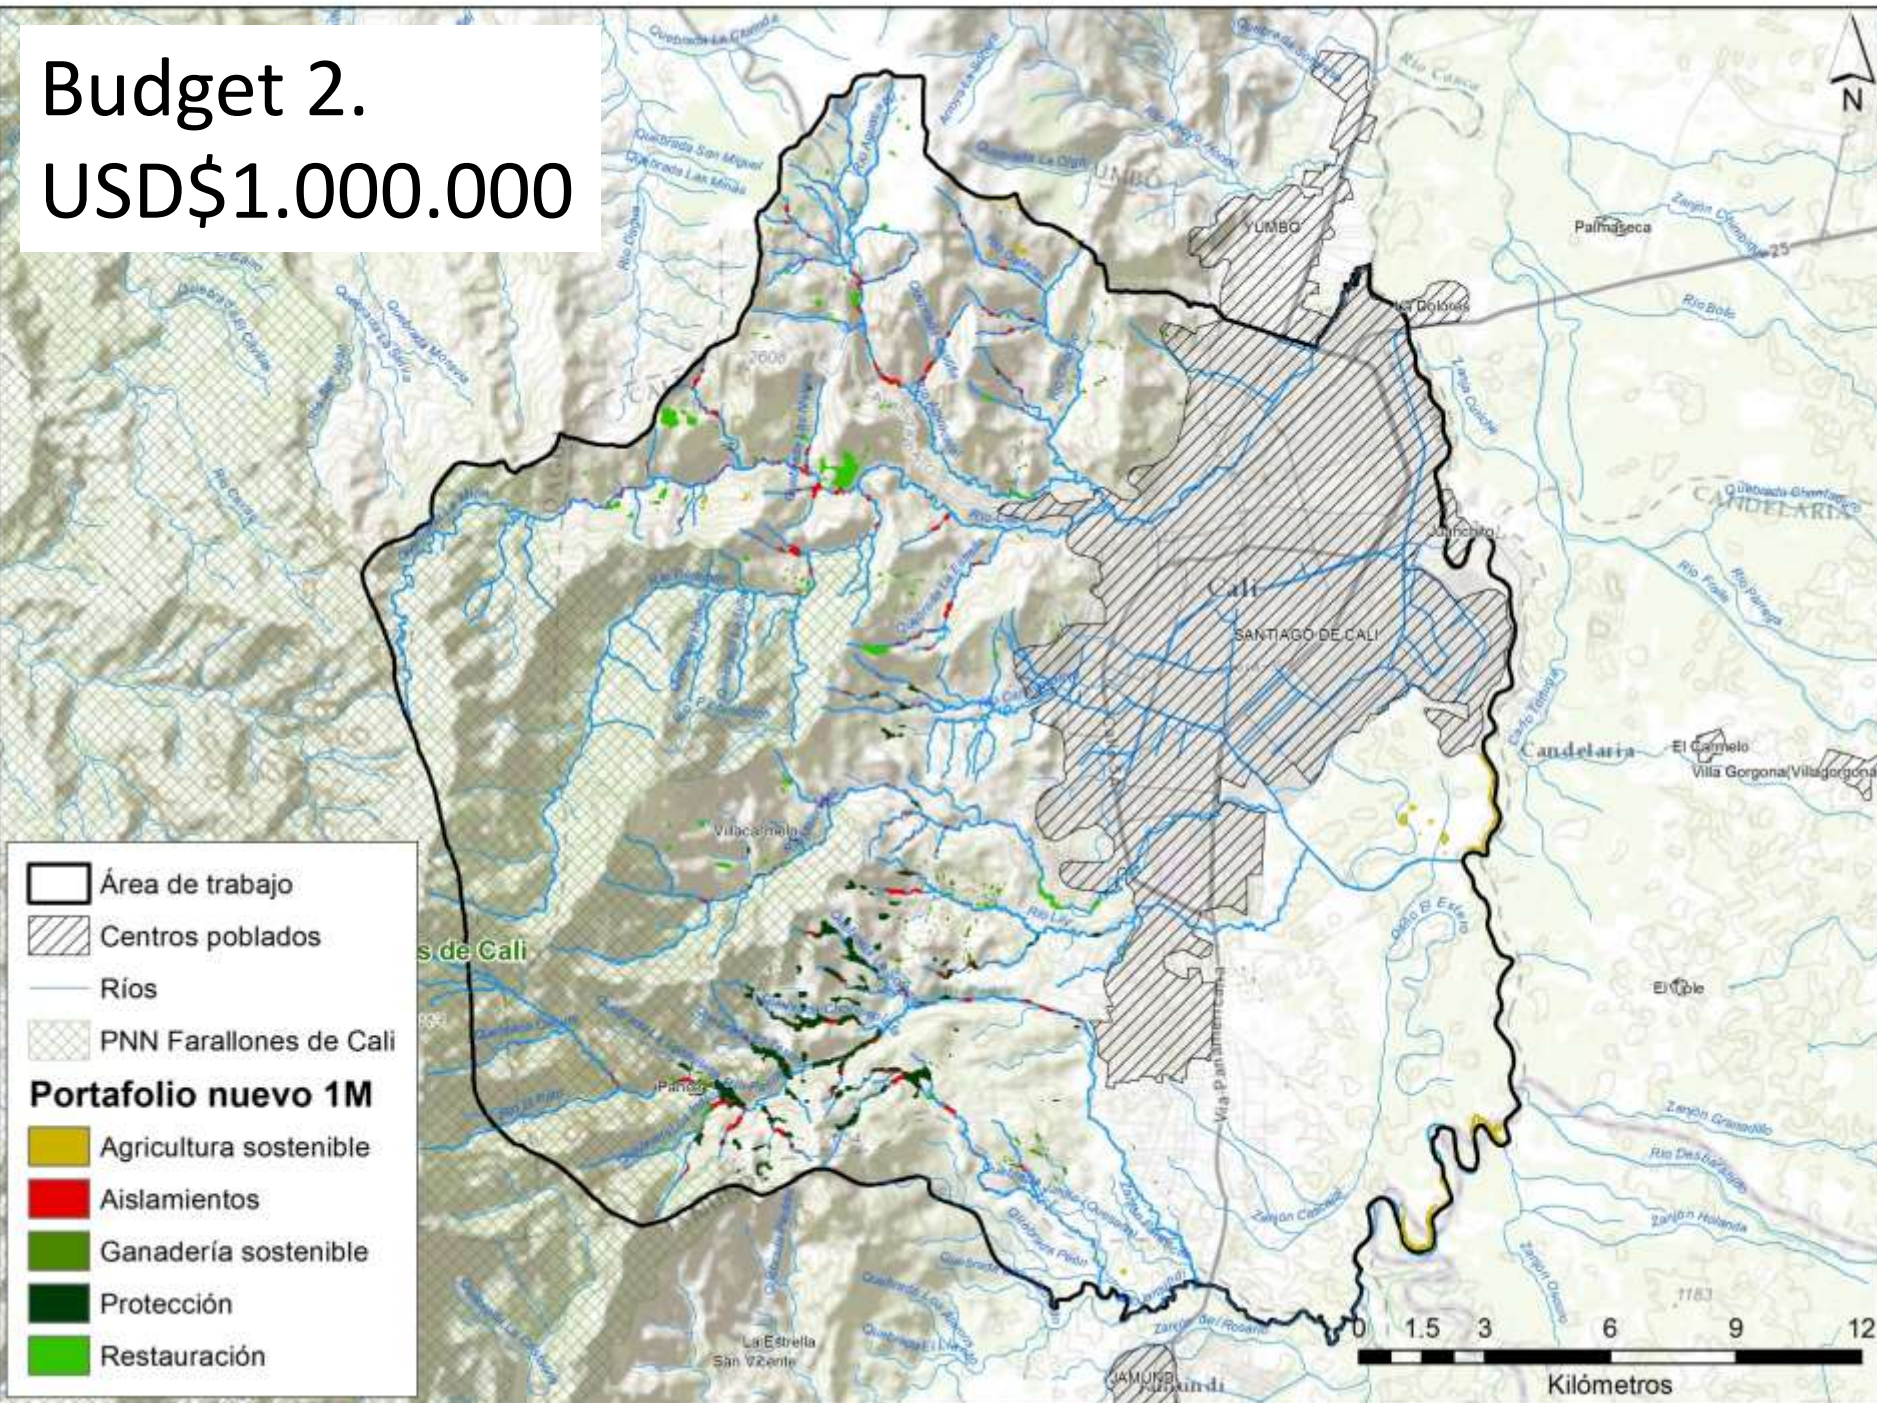

Budget 1.
USD\$500.000

Budget 1. USD\$500.000

Actividad	Costo (USD\$/ha)	Presupuesto asignado USD\$500K	Área esperada USD\$500K (Ha)	Área modelada USD\$500K (Ha)
Protección	200	30,000	150.0	149.94
Restauración	1070	100,000	93.5	93.42
Agricultura sostenible	2930	150,000	51.2	51.12
Ganadería sostenible	2930	150,000	51.2	51.12
Aislamientos	643	70,000	108.9	108.81

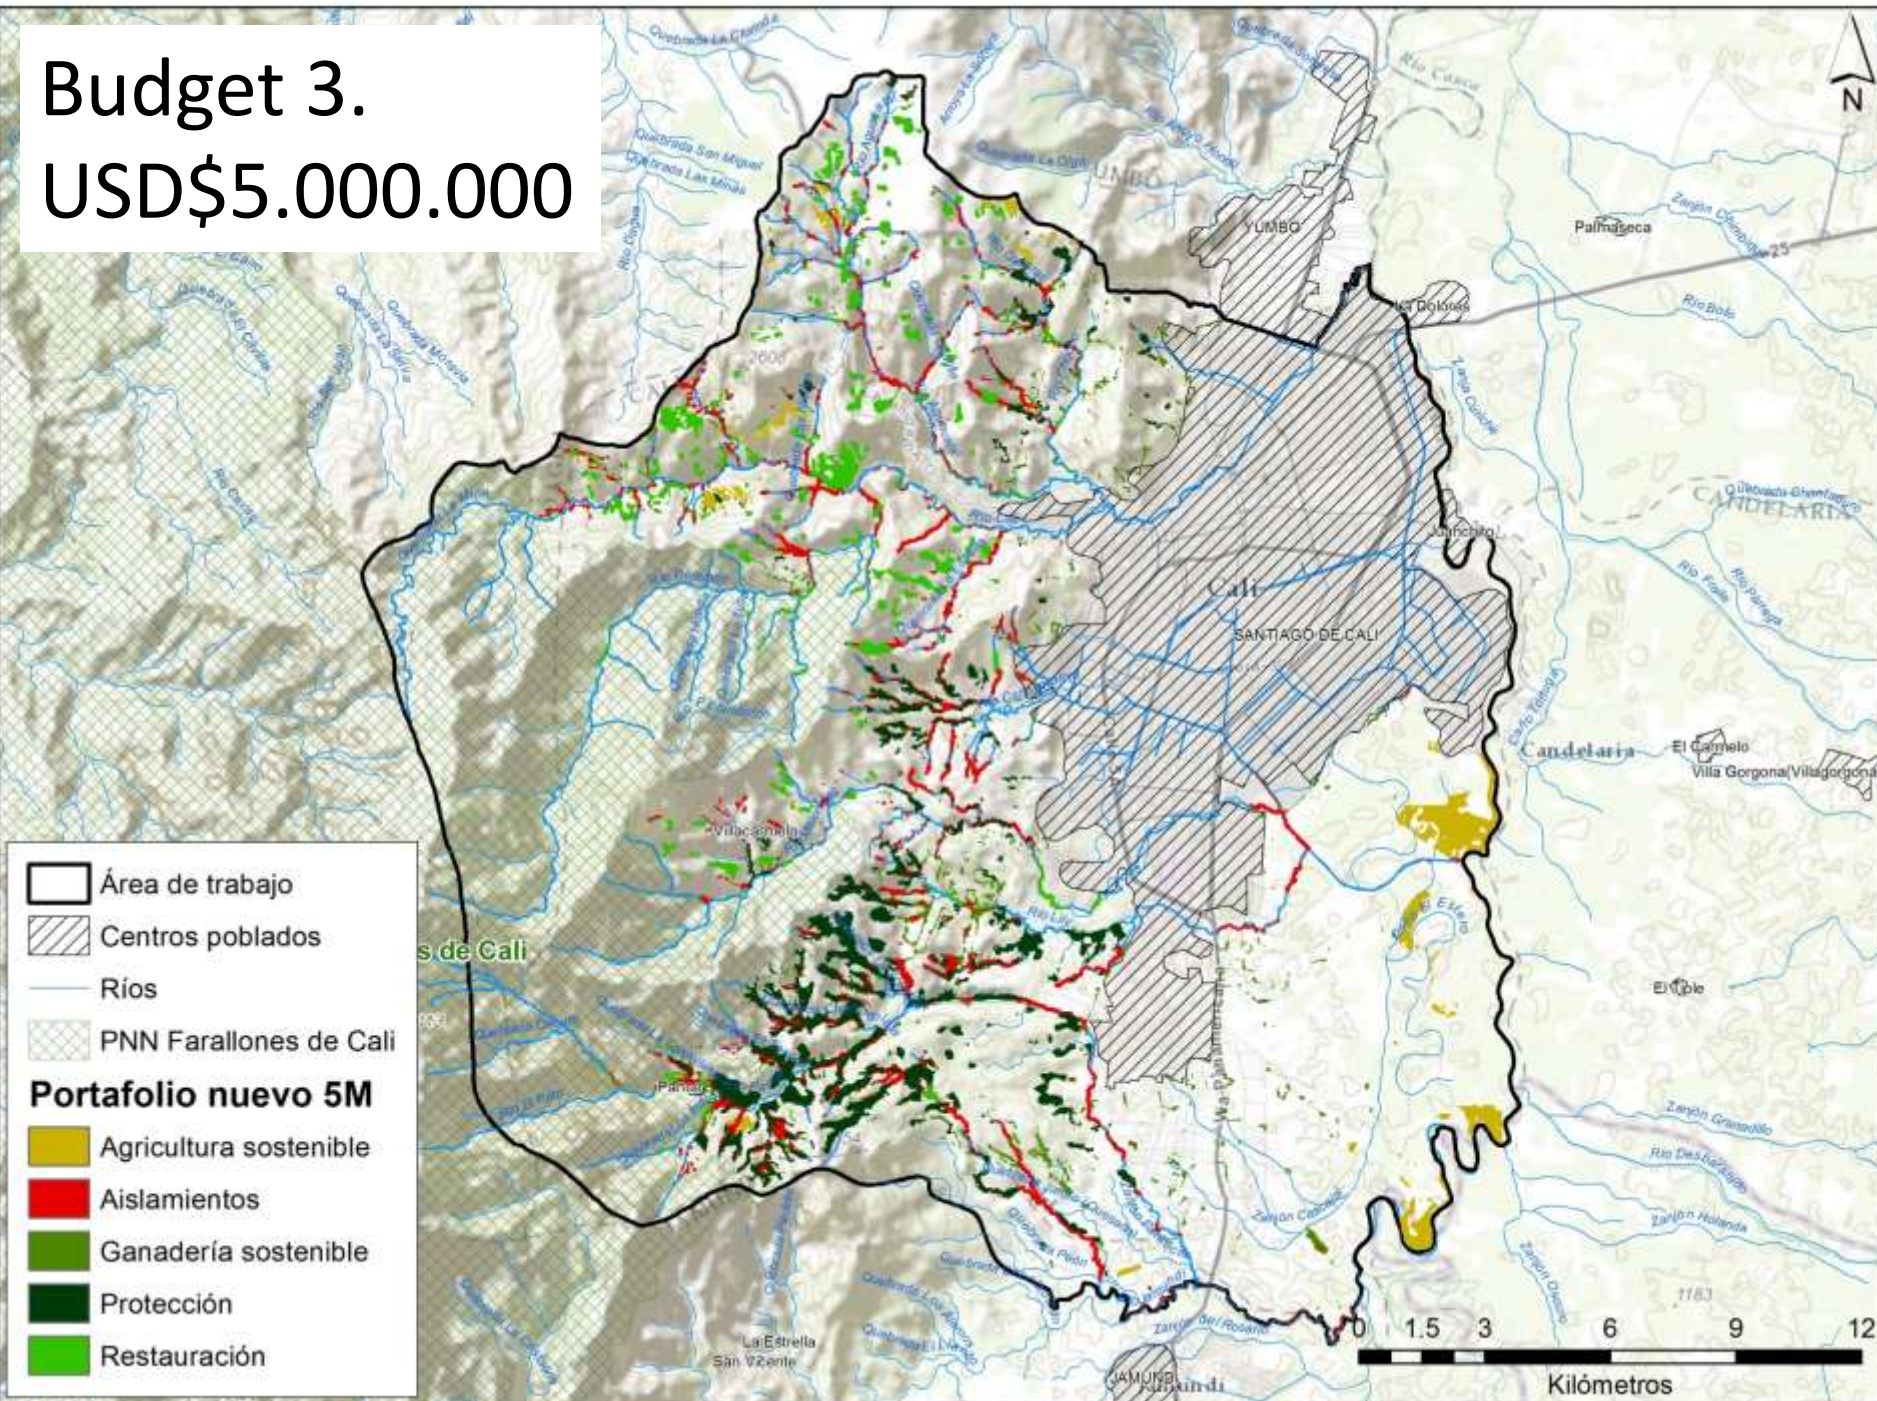

Budget 2. USD\$1.000.000

Budget 2. USD\$1.000.000

Actividad	Costo (USD\$/ha)	Presupuesto asignado USD\$1M	Área esperada USD\$1M (Ha)	Área modelada USD\$1M (Ha)
Protección	200	60,000	300.0	299.97
Restauración	1070	200,000	186.9	186.84
Agricultura sostenible	2930	300,000	102.4	102.33
Ganadería sostenible	2930	300,000	102.4	102.33
Aislamientos	643	140,000	217.7	217.71

Budget 3.
USD\$5.000.000

Budget 3. USD\$5.000.000

Actividad	Costo (USD\$/ha)	Presupuesto asignado USD\$5M	Área esperada USD\$5M (Ha)	Área modelada USD\$5M (Ha)
Protección	200	300,000	1,500	1,499.94
Restauración	1070	1,000,000	935	934.56
Agricultura sostenible	2930	1,500,000	512	511.92
Ganadería sostenible	2930	1,500,000	512	511.92

MONITORING AND IMPACT EVALUATION

March 27, 2014

Leah Bremer
lbremer@stanford.edu

WHY MONITOR?

AND WHAT DOES RIOS HAVE TO DO WITH IT?

- Measure “success”
- Improve RIOS inputs

MONITORING ON THE GROUND

EXAMPLES FROM WATER FUNDS

1. MEASURING 'SUCCESS'

Are we achieving what we say we are?

AGUA POR LA VIDA

VALLE DE CAUCA, COLOMBIA

FOREST & WATER PRODUCERS

GUANDU, BRAZIL

2. IMPROVING RIOS INPUTS

IMPROVING RIOS INPUTS

WHAT INFORMATION DO WE NEED?

- **Land use coefficient table** (e.g. sediment export, sediment retention, rooting depth).
- **Transition weights** (e.g. reforestation vs. pasture management for erosion control)
- **Transition effectiveness** (e.g. park guards, education, fencing → maintain existing vegetation)

CONSERVADOR DAS AGUAS

EXTREMA, BRAZIL

- Land use coefficients?
- How effective are different land uses in erosion control?
- How effective are different activities related to assisted revegetation?

AGUA POR LA VIDA

VALLE DE CAUCA, COLOMBIA

- What are the impacts at the site and microwatershed scales?

AquaFondo

Q & A
